Before Chelation = Baseline Urine

- At least one day prior to chelation, no mineral supplements, chlorella and/or fish shall be consumed. The patient should not smoke after 10PM the night before the test. Ask to list how many cigarettes are smoked on a daily basis.
- Collect a first morning specimen into a standard urine cup.
- Use collected urine to fill the blue capped urine tube, empty tube and refill with 5 to 5ml. Do not fill tube to the rim, because change in pressure during air transportation causes overfilled tubes to leak.
- Fill out submission sheet, place urine tube in protective cover and prepare for shipping.

During Chelation - Collection protocol

- Follow steps 1 and 2 as outlined under Before Chelation (=Baseline Urine).
- Empty bladder prior to administration of chelating agent.
- After administration of chelating agent (oral, IV or IM) patient should consume no fluids other than 3 glasses of water.
- If fasting is impossible, then all foods should be documented in order to judge test results. For example, tea contains manganese, which would influence results.
- Female patients should not menstruate.
- Patient should collect urine in bladder for 2-6hrs depending on chelating agent used. Ask your doctor.
- If the patient is catheterized, the procedure is simple. Clamp the catheter and disconnect urine bag. After that 30mg/kg of DMSA or other chelating agent is administered orally with one cup water.
- If patient is capable of holding urine for the entire collection period, he may collect part of that urine in a regular urine cup.
- Transfer 5-7ml of collected urine into our metal-free urine tube (plastic not glass). Empty and refill tube. This rinsing with the
 patient's own urine, eliminates potential contamination. Contact us for test kits.
- Fill out submission sheet, place urine tube in protective cover and prepare for shipping.
- After all urine has been collected, the patient should drink plenty of water (about 2ltrs) during the remainder of the day.

Notice:

Conventional medical literature still suggests a 24hr collection. Maximum excretion levels varies, depending on the chelating agent used. The metal binding and excretion is influenced by food, drink and smoking. Oral chelating agents should be taken on an empty stomach, with 1 cup of water. It is preferable that the patient remains fasting for 2-4 hours after the intake of the oral chelator. Follow your doctor's suggestion.
